MANAGED SPAM FILTER SERVICE

version: 2.0

**NO MORE SPAM – NO HARDWARE,
NO SOFTWARE, AND NO ADMINISTRATION:**

For enterprises, antispameurope's managed spam filter service offers the perfect solution for spam protection – considering both technical and economic aspects.

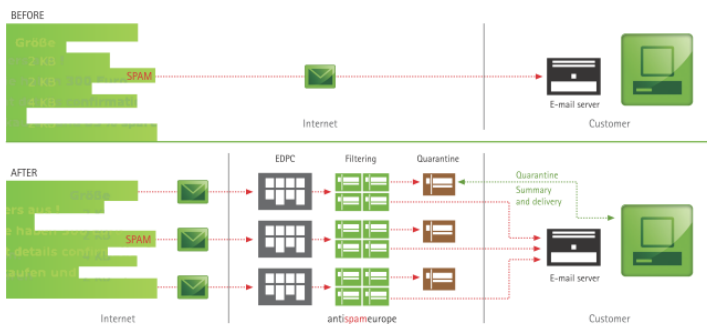

Spam filter software for your workstation or mail server and normal spam filter appliances – they all share one problem: They are installed in-house. Malicious mails may, thus, reach your company and unnecessarily burden your Internet access and infrastructure. In addition, these facilities require thorough administration to provide desired protection levels leading to substantial workload. If administered inappropriately the protection actually intended may even cause opposite effects. Security gaps cause serious damage or mails become lost.

In contrast, antispameurope's managed spam filter service offers obvious advantages. antispameurope's servers operate in redundant secured computer centers. In the Internet, they are installed as protective wall leaving customers' infrastructure unaffected. Spam, viruses, phishing mails and other malware is securely intercepted even before it reaches your company's IT.

A guaranteed detection rate of 99.9% with less than 0.0004% false positives gives antispameurope the lead in the market. The statistic average even reaches a detection rate of over 99.99% with less than 0.0001%. Two independent filters provide secure detection of viruses too – they guarantee a detection rate of 99.99%.

Characteristics – Summary

- 99.9% spam detection guaranteed with less than 0.0004% false positives
- Two independent virus filters
- Active protection from DoS (denial of service) attacks
